9. Summary of Travel Experience (Mv•km) and Accident Data	198

## FOREWORD

This publication contains information pertaining to the sectional traffic volumes and accident rates on roads under Provincial jurisdiction as of December 31, 1983. Such roads include:

- King's Highways;
- Secondary Highways; and
- Tertiary Roads.

The book is divided into two parts:

- Part I -- includes a detailed listing of the above information, section by section; and
- Part II -- includes summary information of "Travel Experience" expressed in millions of vehicle-kilometres (Mv•Km), "Accident Data", and other system volume indicators across the Province.

### PART I:

The highway network is divided into 2,667 sections for reporting purposes. The estimated traffic for different time periods are reported for each section listed. Although local conditions may cause variation in the volume within the sections, the volumes shown are still considered as adequately representative of that section.

Roads possessing more than one route number (i.e., 35/115) are referenced to the lower number. When an overlap occurs between a freeway and a non-freeway reference is made to the freeway route number (i.e., Q.E.W., 400 to 427).

Following is the KEY to reading the listings:

Heading

Description

LOCATION  
DESCRIPTION

A statement identifying the start or ending of a section. Frequent abbreviations used (over the commonly known) include:

IC	:	interchange
JCT	:	junction
LTS	:	limits
BDY / BDRY	:	boundary
TWP	:	township
CORS	:	corners
REG	:	regional
BR	:	bridge
C	:	concessions
CTY	:	county
L	:	lot
R	:	river

DIST (KM)

The length of the section in kilometres reported to one decimal place.

PATT TYPE

One of 14 pattern types that represent the seasonal variability of the traffic flow on the section indicated.

The 14 pattern types represent the traffic flow variation on the whole network. They include:

- |       |   |                   |
|-------|---|-------------------|
| 1. UC | : | urban commuter    |
| 2. SC | : | suburban commuter |
| 3. C  | : | commuter          |

### Heading

PATT TYPE (cont'd)

### Description

- |        |   |                                 |
|--------|---|---------------------------------|
| 4. IC  | : | intermediate commuter           |
| 5. CR  | : | commuter recreation             |
| 6. IR  | : | intermediate recreation         |
| 7. CTR | : | commuter - tourist - recreation |
| 8. IT  | : | intermediate tourist            |
| 9. LT  | : | low tourist                     |
| 10. T  | : | tourist                         |
| 11. HT | : | high tourist                    |
| 12. LR | : | low recreation                  |
| 13. R  | : | recreation                      |
| 14. HR | : | high recreation                 |

The first three are generally referred to as Low Variation Curves (or Commuter Traffic); the next five as Intermediate Variation Curves (a blend of all types of traffic); and the last six as High Variation Curves. For this last group, the first three represent tourist travel and the second three, recreational travel; this sub-grouping is distinguished by the relationship of weekend to weekday traffic.

A graphical presentation of these pattern types has been included on the following page.

# 1983 SEASONAL VARIATION CURVES

**Heading**

**Description**

AADT

Annual Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, January 1st to December 31st.

SADT

Summer Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, July 1st to August 31st, including weekends.

SAWDT

Summer Average Weekday Daily Traffic; which is defined as the average twenty-four hour, two-way, weekday traffic for the period, July 1st to August 31st, excluding weekends. Weekend traffic is defined to start at noon on Friday and end at noon on Monday for a normal short weekend.

A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.

WADT

Winter Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, December 1st to March 31st, including weekends.

## Heading

AR

## Description

Accident Rate; which is defined as the number of reportable accidents occurring annually on a particular highway section for every million vehicle kilometres (Mv•km) travelled on that section during the same period. "Reportable Accidents" are those causing any death, injury or damage exceeding a certain established limit. For example, in 1978, the damage limit was increased from \$200 to \$400.

Mathematically, the accident rate is calculated as follows:

AR = Number of accidents for a given year / Mv•km, noting the following:

- a. multiple vehicle collisions (i.e., chain reactions are generally considered as one accident unless the reporting police officer decides otherwise.
- b. accidents on freeway ramps are totally excluded from sectional and total system accident rate calculations.
- c. the Mv•km is calculated as follows:

$$\text{Mv} \cdot \text{Km} = \frac{\text{AADT} \times 365 \text{ days} \times \text{DIST (km)}}{1,000,000}$$

If no accidents have occurred on a given section, the accident rate is shown as blank, not zero.

### CAVEATS

The user of this publication should realize that the reported data are 'estimated values' and not 'direct measurements' from the field, although some are, indispensably. In fact, less than one-third of the reported sections are measured annually. Such measurement is carried out via three schemes:

1. Permanent Counting Stations at nineteen sites across the Province. Counts are kept 24 hours a day, 365 days a year.
2. Inventory Counting Stations at select locations, based on a set of rational criterial, on a cyclical basis as follows:
  - Three MTC regions cover the counting of their system over 3 years; one, over 4 years; and one, over 5 years.
  - Within each region, some links are counted once per cycle and others, twice per cycle.
  - Each counting can comprise of one, two or three observations. One observation is equivalent to a 24 hour day.
3. Request Counting Stations at random locations as needed.

Using the above information, the historical files and probabilistic models, estimates for the non-counted sections (over two-thirds) are made.

## PART II:

The information in this part is included for the purpose of policy analysis and program planning. It includes summaries about the overall system and not any specifics related to any of the sections.

In particular, it includes the following:

1. Highway Distance (km) by Classification.
2. Number of Sections in the Highway System.
3. Summary of Highway Distance (km) by Volume Range and Traffic Variation.
4. Maximum AADT experienced by type of variation and highway width (in lanes).
5. Distance (km) by Highway Type and Highway Width (in lanes).
6. Highway Distance (in km) by variation type and highway width (in lanes).
7. Historical Trend of Travel Experience (Mv•Km).
8. Historical Trend of Accident Rates.
9. Summary of Travel Experience (Mv•km) and Accident Data.

If the reader requires additional summaries of the Provincial Traffic System, please contact the:

1. All reported Freeway ramp accidents have been excluded.

2. Hwys. overall include Tertiary roads.

3. Mv·km is million vehicle kilometres of travel.

4. Mv·km for Provincial Total & Other Roads is based on total taxed gasoline & motor fuel sales and average vehicle fuel consumption (1983 = 20.5ℓ / 100 km)

5. Mv·km for Hwys. Overall (and components) is based on estimated traffic volumes and reported section lengths.

6. RATE is the number of accidents per million vehicle kilometres of travel (Mv·km).

Traffic Characteristics  
June, 1985

## PREFACE

This publication with an annual distribution of 1500 copies, is the most widely used reference document for traffic volume information by this ministry and other agencies. It contains basic reference information on the traffic usage of the provincial highway network for anyone requiring a measurement of annual and seasonal data.

To complement the volume data, which forms the main body of the report, the first part contains a number of summaries and overall system indicators. Various relationships among highway classification or type, traffic accidents, volume ranges, distance and travel experience are drawn to give comparative measurements for the entire provincial highways network.

The main body of this report contains selected information. Additional information on traffic characteristics such as traffic composition, peak hours or intersection usage, may be obtained by contacting the Highway Program Planning Office or the Regional Traffic Offices.

For a comprehensive overview of all traffic volume aspects, the P.C.S. Report and the Historical and Short Term Projections listings provided by the Highway Program Planning Office, should be consulted.

A handwritten signature in dark ink, appearing to read 'R.K. Kher', is written over a single horizontal line that extends to the left and then continues to the right below the signature.

R.K. Kher,  
Manager,  
Highway Program Planning Office.

## INTRODUCTION

This publication contains information pertaining to traffic volumes and accident rates on roads under Provincial jurisdiction as of December 31, 1984. The book is divided into two parts.

## PART I

The information in this part is included for policy analysis and program planning purposes. It includes summaries about the overall Provincial Highways system and not specifics related to individual volume sections. The system indicators are developed from travel experience, accident data and highway geometrics.

## PART II

The information in this part is a detailed listing of traffic volumes on Provincial Highways, section by section.

The highway network is divided into 3,295 sections for reporting purposes. Seasonal traffic volume variations are estimated for each section reported. Although local conditions cause variations in the volume within the sections, the volumes shown are considered to adequately represent the section.

On highways possessing more than one route member, such as Highways 35 and 115, the volume information is referenced to the lower number highway. When an

overlap occurs between a freeway and non-freeway, reference is made to the freeway route number. The freeways are Highways 400 to 427 and the Q.E.W.

The following is a KEY to reading the listings:

## LOCATION DESCRIPTION

A statement identifying the start or ending of a section. Frequent abbreviations used (over the commonly known) include:

IC	:	interchange
JCT	:	junction
LTS	:	limits
BDY/BDRY	:	boundary
TWP	:	township
CORS	:	corners
REG	:	regional
BR	:	bridge
C	:	concession
CTY	:	county
L	:	lot
R	:	river

## DISTANCE (KM)

The length of the section in kilometres reported to one decimal place.

### PATTERN TYPE

One of 14 pattern types that represent the seasonal variability of the traffic flow on the section indicated.

The 14 pattern types represent the traffic flow variation on the whole network. They include:

- |        |   |                                 |
|--------|---|---------------------------------|
| 1. UC  | : | urban commuter                  |
| 2. SC  | : | suburban commuter               |
| 3. C   | : | commuter                        |
| 4. IC  | : | intermediate commuter           |
| 5. CR  | : | commuter recreation             |
| 6. IR  | : | intermediate recreation         |
| 7. CTR | : | commuter - tourist - recreation |
| 8. IT  | : | intermediate tourist            |
| 9. LT  | : | low tourist                     |
| 10. T  | : | tourist                         |
| 11. HT | : | high tourist                    |
| 12. LR | : | low recreation                  |
| 13. R  | : | recreation                      |
| 14. HR | : | high recreation                 |

The first three are generally referred to as Low Variation Curves (or Commuter Traffic); the next five as Intermediate Variation Curves (a blend of all types of traffic); and the last six as High Variation Curves. For this last group, the first three represent tourist travel and the second three, recreational travel; this sub-grouping is distinguished by the relationship of weekend to weekday traffic.

A graphical presentation of these pattern types has been included on the following page.

### AADT

Annual Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, January 1st to December 31st.

### SADT

Summer Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, July 1st to August 31st, including weekends.

### SAWDT

Summer Average Weekday Daily Traffic; which is defined as the average twenty-four hour, two-way, weekday traffic for the period, July 1st to August 31st, excluding weekdays. Weekend traffic is defined to start at noon on Friday and end at noon on Monday for a normal short weekend.

A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.

### WADT

Winter Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period, December 1st to March 31st, including weekends.

# PATTERN TYPES VARIATION CURVES

SEASONAL VARIATION FACTORS

SEASONAL VARIATION FACTORS

AWD..... AVERAGE WEEKDAY ( 4 DAYS )

ADT ——— AVERAGE DAILY TRAFFIC

## AR

Accident Rate; which is defined as the number of reportable accidents occurring annually on a particular highway section for every million vehicle kilometres (Mv.km) travelled on that section during the same period. "Reportable Accidents" are those causing any death, injury or damage exceeding a certain established limit. For example, in 1978, the damage limit was increased from \$200 to \$400.

Mathematically, the accident rate is calculated as follows:

AR = Number of accidents for a given year / Mv.km, noting the following:

- a. multiple vehicle collisions (i.e., chain reactions are generally considered as one accident unless the reporting police officer decides otherwise).
- b. accidents on freeway ramps are totally excluded from sectional and total system accident rate calculations.
- c. the Mv.km is calculated as follows:

$$\text{Mv.Km} = \frac{\text{AADT} \times 365 \text{ days} \times \text{DIST (km)}}{1,000,000}$$

If no accidents have occurred on a given section, the accident rate is shown as blank, not zero.

## CAVEATS

The user of this publication should realize that the reported data are 'estimated values'. Since traffic volumes are not static, direct field measurements are accurate only for the time of the count. Also, the size of the Provincial Highways network makes it impractical to measure each section annually. Thus, less than one third of the reported sections are counted each year. The following three methods of measuring traffic volumes are employed:

1. Permanent Counting Stations: At nineteen locations across the Province counts are taken for each hour of the year.
2. Inventory Counting Stations: Each unique volume section has a set location where traffic volumes are sampled on a cyclical basis by season and year.
3. Request Counting Stations: Traffic volumes are measured at random locations as needed to address operational or planning concerns.

By using the above information plus historical files and probabilistic models, estimates are made for each volume section.

# PART I

## Overall System Summaries

## HISTORICAL TREND OF TRAVEL EXPERIENCE

### HIGHWAYS OVERALL

- Increase of MV·km is mostly due to TRAFFIC VOLUMES. Highway Network increased by 1/2 of 1%. Traffic Volumes increased by 2%.
- Average growth of 1000 MV·km per year up to 1978 leveled off and then changed to decreases in 1981 and 1982.
- In 1983 and 1984, a growth of approximately 1000 MV·km is measured again. Almost all Traffic Volume growth occurred on Freeways.

## HISTORICAL TREND OF ACCIDENT RATE

### HIGHWAYS OVERALL

- Over the last 5 years, accident rates have basically remained level for all types of highways.
- The rate has remained constant because increases/decreases in the NUMBER of accidents have been offset by corresponding increases/decreases in MV·km.
- The apparent downtrend since 1975 was caused by changes in accident reporting methods.

- NOTE. 1. All reported Freeway ramp accidents have been excluded.  
 2. Hwys. overall include Tertiary roads.  
 3. Mv-km is million vehicle kilometres of travel.  
 4. Mv-km for Provincial Total & Other Roads is based on total taxed gasoline & motor fuel sales and average vehicle fuel consumption (1984 = 20.5L/100 km).  
 5. Mv-km for Hwys. Overall (and components) is based on estimated traffic volumes and reported section lengths.  
 6. RATE is the number of accidents per million vehicle kilometres of travel (Mv-km).

## HIGHWAY DISTANCE (km) BY CLASSIFICATION

CLASSIFICATION	LENGTH	% OF TOTAL
FREEWAYS	1,492.9	7.0
KING'S HIGHWAYS	14,290.8	66.5
SECONDARY HIGHWAYS	5,418.6	25.2
TERTIARY ROADS	278.8	1.3
TOTALS	21,481.1	100.0

## HIGHWAY DISTANCE (km) BY CLASSIFICATION AND No OF LANES
